NEED ANALYSIS (Why the procurement was necessary?)	The block area falls in the very complex tectonic/ geological/ stratigraphic setup of the Kohat-Potwar sub basin Fold & Thrust belt zones in Upper Indus Basin of Pakistan. The study area is characterized by severe thrusting/ faulting, repetitions of formations and presence of thick salt units in the sub-surface. Exploration in these complex tectonic zones generally have seismic & drilling challenges, which need to be address by conducting a comprehensive Geological Structural Modelling study for the better understanding of structural styles, chronology of structuration and identification/ integrity of structural traps, before drilling the costly exploratory wells. In the block area upto now three exploratory wells (Drabo Kas-01, Khawaja-01 & Surqamar-01) have been drilled and all the drilled wells were not conclusive due to severe thrusting in the shallow sections and presence of thick salt. The E&P companies worldwide usually carry out such type of studies to mitigate risk before finalizing a prospect. This planned

	study will be used for future Geomechanical studies including Fault Seal analysis, Fracture and Pore pressure/ Stress direction identification.
