### ACCEPTABLE QUALITY LEVELS (AQLS)

 Acceptable Quality Level (AQL) is maximum average defective items in a tot or limit/ percentage of defective items in product /offered store. It is expressed in a percentage. Number of average defective items is determined by following formula:

Average defective item= No.of defective item found during inspection x 100

AQL process: it is used for inspection of finished product by the QC professionals.
 AQL standard is depend on the quality of the product to be inspected, random sampling, and experience of inspector Following AQL table is used to determine lot size/ offered store quantity, least No. of sample to be inspected, AQL%, and acceptance & rejection points:

3. If the inspector have time constrain then AQL is beneficial/ helpful in inspection of whole lot/ offered store. It safe time, cost and give effective/ statistical result of product /offered store, e.g. If inspector needs 5 minutes to check the item, the quantity to be inspected is 2,500 items then it took 208 hours to check the whole consignment/ offered store. It means 26 days approx, for one store, Calculation is as follows:

$$\frac{5 \min \times 1 \, hr}{1 \, item \times 60 \, min} \times 2,500 \, items = 208.33 \, hrs \equiv 26 \, days$$

After Implementing AQL standard so the sample taken from the lot/ offered store is 200 items/ sample:

$$\frac{5 \min \times 1 \ hr}{1 \ item \times 60 \ min} \times 2,00 \ items = 16.66 \ hrs = 02 \ days$$

 Quality parameters/ AQL limits may be defined by Inspecting Authority (if deemed appropriate) and communicate to the manufacturer, so the manufacturer set their quality levels (AQL limits) accordingly for their internal audit. Therefore, good quality product is ready for inspection.
